[Ir a la documentación](#)

× Agrega Firebase a tu aplicación web

✓ Registrar app

2 Agrega el SDK de Firebase

☒ Usar npm ☐ Usar una etiqueta <script>

Si ya usas [npm](#) y un agrupador de módulos como [Webpack](#) o [Rollup](#), puedes ejecutar el siguiente comando para instalar la versión más reciente del SDK ([más información](#)):

```
$ npm install firebase
```

Luego, inicializa Firebase y comienza a usar los SDK de los productos que quieres utilizar.

```
// Import the functions you need from the SDKs you need
import { initializeApp } from "firebase/app";
// TODO: Add SDKs for Firebase products that you want to use
// https://firebase.google.com/docs/web/setup#available-libraries

// Your web app's Firebase configuration
const firebaseConfig = {
  apiKey: "AIzaSyBQSLTdLE7gS0n13WM39SHF5TES_KsalkM",
  authDomain: "birthday-ba324.firebaseio.com",
  projectId: "birthday-ba324",
  storageBucket: "birthday-ba324.appspot.com",
  messagingSenderId: "666231146609",
  appId: "1:666231146609:web:37649f384d6ac7f2f773d0"
};

// Initialize Firebase
const app = initializeApp(firebaseConfig);
```

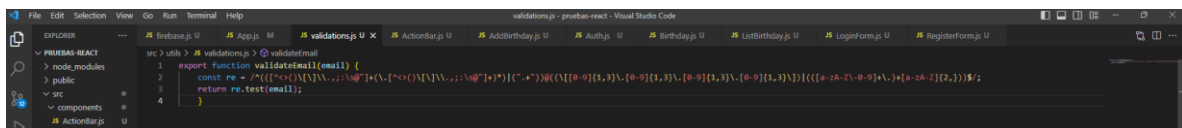

Nota: Esta opción utiliza el [SDK de JavaScript modular](#), que proporciona un tamaño reducido del SDK.

Obtén más información sobre Firebase para la Web: [primeros pasos](#), [referencia de la API del SDK web](#) y [muestras](#)

```

1 rules_version = '2';
2
3 service cloud.firestore {
4   match /databases/{database}/documents {
5     match /{document=**} {
6       allow read: if request.auth.uid !=null;
7       allow write: if request.auth.uid !=null;
8     }
9   }
10 }

```

```

```

The image shows a Visual Studio Code editor window with the title bar "Authjs - pruebas-react - Visual Studio Code". The Explorer sidebar on the left shows a project structure for "PRUEBAS-REACT". The file "Authjs" is selected under the "components" directory. The main editor area displays the code for "Authjs" in a dark theme. The code imports React, useState, StyleSheet, View, Text, and Image from "react" and "react-native". It defines a default function Auth() that uses useState to manage login state and a changeForm function. The component is rendered as a View containing an Image and a LoginForm. The styles are defined using StyleSheet.create.

```
1 import React, { useState } from "react";
2 import { StyleSheet, View, Text, Image } from "react-native";
3 import LoginForm from "../LoginForm";
4 import RegisterForm from "../RegisterForm";
5 export default function Auth() {
6   const [isLogin, setIsLogin] = useState(true);
7   const changeForm = () => {
8     setIsLogin(!isLogin);
9   };
10  return (
11    <View style={styles.view}>
12      <Image style={styles.logo}
13        source={require("../assets/logo.png")} />
14      {isLogin ? (
15        <LoginForm changeForm={changeForm} />
16      ) : (
17        <RegisterForm changeForm={changeForm} />
18      )}
19    </View>
20  );
21 }
22 const styles = StyleSheet.create({
23   view: {
24     flex: 1,
25     alignItems: "center",
26   },
27   logo: {
28     width: "80%",
29     height: 240,
30     marginTop: 50,
31     marginBottom: 50,
32   },
33 });
34
```
